As a social science, it involves understanding the rationalizations and biases that affect moral decision-making.

Moral cognition also involves the scientific study of the brain that is evolving along with technology.

Researchers who study moral cognition attempt to provide social and biological explanations for how our brains process information and make moral or immoral choices.

Some scientists examine genetic and molecular influences, while others use neuroimaging to map the areas of the brain that direct people's choices.

So, the study of moral cognition does not aim to tell people what choices they should make.
